Generally, if it's water in the oil, it's a liner O-ring. Oil in the water is usually the cooler. Cheapest way to check is to drop the oil pan, and pressurize the coolant system. You will then see it drip from the liner(s) if it's an O-ring. Just make sure you use proper coolant when refilling.

DT466 Water In Oil | The Diesel Stop

This repair involved checking oil pressures on the engine side and the high pressure side and helped us determine what was causing the problem. This was the first place to start for us and since the engine would not run it made us make a decision to start from the source of the oil flow which was the engine oil pump system.

Working on a 2000 dt466e. Coolant is mixing with the oil in the crankcase. It has a new oil cooler. It does not overheat. It is not smoking nor missing. I removed the oil pan pressurized the cooling system and there are no leaks. The pressure remained at 14 psi for 15 min. That is when I stopped the test.
