Acoustic Fatigue Analysis Of Weld

Acoustic Fatigue Analysis Of Weld The nominal stress method is a relatively simple and inexpensive method to compute the fatigue life in a weld, and it is quite well adapted for using COMSOL Multiphysics to obtain the loads and stress distribution. Effective Notch Stress Method.

Analysis Methods for Fatigue of Welds - nCode

As a part of the present work, fatigue tests have been performed with test specimens fabricated by the current industry standard for welded offshore steel structures. The fatigue tests show that the degree of bending (DOB) has an influence on the fatigue lifetime. The fatigue lifetime decreases significantly when increasing the bending stress.

The crack propagation of different weld joint samples were detected by acoustic emission (AE) technique. The samples were from the basic metal, weld seam and heat affected zone (HAZ), The results showed that the crack growth rate of basic metal was higher than weld seam and HAZ because of the transverse compressive residual stress in joint.
