An Introduction To Using Gis

GIS stands for "Geographic Information System". GIS is a very broad term, and trying to get a consistent definition can be tricky. Ask ten different GIS users and you will likely get ten different answers. It could be argued (and the propeller heads often do) that any digital data that contains location based information is in fact a GIS.

A Geographic Information System is a multi-component environment used to create, manage, visualize and analyze data and its spatial counterpart. It's important to note that most datasets you will encounter in your lifetime can all be assigned a spatial location whether on the earth's surface or within some arbitrary coordinate system (such as a soccer field or a gridded petri dish).

A GIS is a system of computer hardware, computer software and geographical data. A GIS Application allows you to view geographical data and is an important part of the GIS. A GIS Application normally consists of a menu bar, toolbars, a map view and a legend. Vector and raster data are geographical data used in a GIS application.

Introducing GIS - Documentation

The point is that a GIS is a tool we use to help us to store and manipulate large datasets and to perform complex operations that would take a human a long time (with plenty of opportunity for errors) to do. However, the algorithms and storage techniques that it uses are usually analogous to human thought processes.
