Artificial neural networks are designed to function as a biological neural network. In the biological process, a dendrite first receives some sort of impulse. That impulse is then translated across...

An artificial neural network is an effective tool for pattern analysis. A neural network allows decision rules of greater complexity to be applied in pattern classification. By formulating the land-suitability-assessment problem into a pattern—classification problem, neural networks can be used to achieve results of greater accuracy.

Artificial neural networks (ANNs), usually simply called neural networks (NNs), are computing systems vaguely inspired by the biological neural networks that constitute animal brains.. An ANN is based on a collection of connected units or nodes called artificial neurons, which loosely model the neurons in a biological brain. Each connection, like the synapses in a biological brain, can ...

Artificial intelligence (AI) develops programmed agents (systems) that match or outperform people's abilities to make decisions, to learn, and to plan. To do so, AI develops algorithms and methodologies that sense a system's environment, decide what to do given that data, and effect its chosen actions in its environment.

Currently, the principal method of controlling gearbox failure is to regularly overhaul the complete system. This paper considers the feasibility of using a neural network to perform fault detection on vibration measurements given by accelerometer data. The details and results obtained from studying the neural network approach are presented.

The rise of artificial neural networks and parallel distributed processing in the 80's started to undermine the atomistic symbolic assumption leading to a subsymbolic processing paradigm where cognitive architectures became biologically grounded on the distributed nature of brain architectures [Rumelhart, et al., 1986; Hopfield, 1982].
