Infection. Infection is a potential complication in any surgical procedure, including total knee replacement. Infection may occur while you are in the hospital or after you go home. It may even occur years later. If an artificial joint becomes infected, it may become stiff and painful. The implant may begin to lose its attachment to the bone.

### **Jürgen Messner (@PaedsOrthopod) | FDNitter**

Bones begin to heal very quickly after a fracture and the bone tissue will knit together with any nearby bone fragments to form a callus of cartilage and eventually new bone tissue. The ultimate goal of bone healing is to reach a proper union of the fractured bone pieces that restores the original bone anatomy and restores full function to the muscles and joints that move the bone.
