Leaks originating from outside the building and from wet areas in the building provide the environment suitable for Stachybotrys to grow. Stachybotrys is a greenish-black mould that grows on materials containing cellulose such as wood fibreboard, fibre-cement, the lining paper of gypsum board, kraft paper wall and roof underlays, wallpaper and timber when it is subject to repeated wetting.

Moderate to steep pitched roofs do not often fail, but low-sloped and horizontal membrane roof systems do. These need to be designed and installed accurately, and any low-sloped or flat building surface that may actually be part of a wall (such as the top of a parapet) needs to be treated as a roof surface.
