### Entrapment Of The Proximal Sciatic

Abstract. Because the sciatic nerve is the longest single nerve in the body, there are multiple sites where nerve entrapment may occur. The sciatic nerve may mimic hip pathology, sacroiliitis, hamstring muscle strain, and piriformis syndrome.

Entrapment of the proximal sciatic nerve caused by tendinous structures along the hamstring muscles, "the hamstring syndrom e", is a clinical entity .

The purpose of this study was to evaluate the results of operative treatment of entrapment of the sciatic nerve by tight fibrous structures associated with the hamstring tendons close to their proximal insertion. We retrospectively evaluated the results of 22 operations performed in 16 patients (6 bilateral operations), on average six years postoperatively.

Entrapment of the proximal sciatic nerve by the hamstring tendons is not presented in standard textbooks. However, this condition is not extremely rare.

The course of the sciatic nerve in the back of the thigh, in closeness to the femur, has been indicated as a critical site of susceptibility of the nervous trunk where uncommon entrapments syndromes may occur. This report presents the case of sciatic nerve entrapment at this site, which was associated with a limited hyperostosis of the femur.

In the subgluteal space the sciatic nerve can be entrapped as it passes under piriformis and over the obturator, gemelli and/or quadratus femoris muscles. 5 The sciatic nerve can be entrapped in ischiofemoral impingement between the ischium and lesser trochanter. 6,7 Also at the level of the ischium, the proximal hamstring can be involved in sciatic nerve entrapment and is known as ischial ...

The nerves were then dissected and divided into segments based upon their distance from the site of nerve compression (proximal, entrapment and distal). These segments were then immersed in 2% glutaraldehyde in 0.1 M cacodylate buffer, pH 7.4, for 2 h followed by 1% osmium tetroxide with 0.8% potassium ferricyanide and CaCl 2 in 0.1 M cacodylate buffer, pH 7.4, for 1 h.

Etiologies of sciatic nerve entrapment are fibrous bands containing blood vessels10, 11 and gluteal, 2 piriformis,5, 11 or hamstring muscles. 12 Given the variation of anatomic entrapment, it has been suggested that the term "deep gluteal syndrome" (DGS) be used because entrapment of the sciatic nerve may occur from any of the gluteal region anatomy 2 or the non-discogenic sciatica. 13 ...

Peripheral nerve entrapment occurs at specific anatomic locations. Familiarity with the anatomy and the magnetic resonance imaging (MRI) features of nerve entrapment syndromes is important for accurate diagnosis and early treatment of entrapment neuropathies. The purpose of this paper is to illustrate the normal anatomy of peripheral nerves in the upper and lower limbs and to review the MRI ...

Sciatica occurs when the sciatic nerve becomes pinched, usually by a herniated disk in your spine or by an overgrowth of bone (bone spur) on your vertebrae. More rarely, the nerve can be compressed by a tumor or damaged by a disease such as diabetes. Risk factors. Risk factors for sciatica include: Age.
