A Look at Psychopharmacology and Theories of Depression. By David Gurevich June 11, 2010. We now believe that depression is in part a biochemical event. This theory did not come from nowhere – rather it comes from just 60 years of experimenting with medications that had biochemical effects. But at the same time as we have learned that depression is, indeed, in part biochemical, the limitations of medications remind us how little we ultimately know.

overview. For the past sixty years, virtually all pharmacological treatments of depression have been predicated on a monoaminergic model. This began with the discovery of the antidepressant effects of iproniazid, a monoamine oxidase inhibitor, and continued through the discovery and development of TCA's, SSRI's, SNRI's, and newer medications like bupropion, mirtazapine, and even the second generation antipsychotics.
