On the curved leg the switch point rail makes an angle of about 1° or 2° when the point is against the straight stock rail, which is a sudden change for wheels. Model turnouts may have a slightly curved switch point rail on the curved leg because the turnouts are small compared to the prototype. Both rails are straight going through the frog.

And, because it is not as strong (stiff), aluminum trailers use more (volume). The increase in volume compensates, in part because aluminum is 1/3 the mass (by volume) than steel, so the overall trailer is lighter. The nice thing, because it is more expensive building with aluminum, trailers are usually built well.

Rich Internet Applications (RIAs) promise the dynamism and functionality of desktop applications through the browser. One of the key characteristics is moving your presentation layer to the client and backing it with a robust RESTful service layer on the server. This idea is being popularized with buzzwords like SOUI (Service Oriented User Interface) and SOFEA (Service Oriented Front End ...
