Triangle Congruence Postulates The first two postulates, Side-Angle-Side (SAS) and the Side-Side-Side (SSS), focus predominately on the side aspects, whereas the next lesson discusses two additional postulates which focus more on the angles. Those are the Angle-Side-Angle (ASA) and Angle-Angle-Side (AAS) postulates.

If all three pairs of corresponding sides are congruent, the triangles are congruent. This congruence shortcut is known as side-side-side (SSS). Another shortcut is side-angle-side (SAS), where two pairs of sides and the angle between them are known to be congruent. SSS and SAS are important shortcuts to know when solving proofs.

The Side Angle Side postulate (often abbreviated as SAS) states that if two sides and the included angle of one triangle are congruent to two sides and the included angle of another triangle, then these two triangles are congruent. The SSS postulate states that If three sides of one triangle are congruent to three sides of another triangle, then the triangles are congruent.

Lesson 2.05 Triangle Similarity: SSS and SAS

These are the SSS, SAS, and ASA postulates. There is no formal way to prove that they hold true, but they are accepted as valid methods for proving the congruence of triangles. One final postulate has been assumed all along in the study of geometry: a given geometric figure can be moved from one place to another without changing its size or shape.
