High-temperature effects in hypersonic flows where ρ (kg/m³) is the mass density of the gas, p (Pa) is the static pressure, u, w (m/s) are the Cartesian components of velocity, and e (J/kg) is the specific total energy given by: where e (J/kg) is the specific internal energy of the gas. High-temperature effects in hypersonic flows

Finally, the increased temperature of hypersonic flows mean that real gas effects become important. For this reason, research in hypersonics is often referred to as aerothermodynamics, rather than aerodynamics. The introduction of real gas effects means that more variables are required to describe the full state of a gas.

Hypersonic and High-Temperature Gas Dynamics Chapter 3 Notes. Newton's ideas are as old as reason and as new as research. A striking difference between linear and nonlinear waves concerns the phenomenon of interaction: the principle of superposition holds for linear waves but not for nonlinear waves. As a consequence, for example, excess pressures of interfering sound waves are merely additive: in contrast to this fact, interaction and reflection of nonlinear waves may lead to enormous ...

Hypersonic and High-Temperature Gas Dynamics, 2e

When operating any hypersonic facility, the gas needs to have a high temperature. Temperature and pressure are exchanged for velocity; consequently, the gas must start at a high temperature. In any scenario where there are high pressures and high temperatures, there is a risk of something exploding or burning.
