Male breast hosts various pathological conditions just like "female breast." However, histo-anatomical diversities with female breast lead to many differences regarding the frequency and presentation of diseases, the radiologic appearance of lesions, the diagnostic algorithm, and malignity features. Radiological modalities may play an important role in evaluating male breast lesions.

However, imaging of the various thrombotic complications and the identification of plaques that are prone to rupture are at best indirect, mostly unreliable, or not available at all. The development of molecular imaging toward diagnosis and prevention of thrombotic disease holds promise for major advance in this clinically important field.

Imaging may be employed to exclude other diseases when the diagnosis is unclear or to assess for complications when the patient fails to respond to empiric therapy. CT has low sensitivity for uncomplicated meningitis; increased density within the subarachnoid spaces or leptomeningeal enhancement may be seen in some cases.

Small airways disease includes a spectrum of inflammatory and fibrotic pulmonary diseases centered on the small conducting airways. High-resolution computed tomography plays a key role in the detection and classification of small airways disease and, when combined with relevant clinical and pathologic findings, leads to a more accurate diagnosis. The imaging manifestations of small airways ...

Introduction. Liver ultrasonography and magnetic resonance (MR) imaging is increasingly used for detecting, characterizing and assessing the response to treatment of focal and diffuse liver diseases, .Ultrasonography remains a first-line examination, but it has recently gained increasing capabilities due to the implementation of dynamic contrast-enhanced (DCE) studies and elastography.
