We term these models population intervention models. The estimating equation approach provides a convenient mathematical method for deriving a class of estimators for a wide variety of causal inference problems. However, before applying the machinery (van der Laan & Robins, 2002), one must first define the parameter of interest.

Causal inference goes beyond prediction by modeling the outcome of interventions and formalizing counterfactual reasoning. In this blog post, I provide an introduction to the graphical approach to causal inference in the tradition of Sewell Wright, Judea Pearl, and others. We first rehash the common adage that correlation is not causation.

Potential outcomes framework (Rubin causal model), propensity score matching and structural causal models are, arguably, the most popular frameworks for observational causal inference.

Systems models, which by design aim to capture multi-level complexity, are a natural choice of tool for bridging the divide between social epidemiology and causal inference. In this commentary, we discuss the potential uses of complex systems models for improving our understanding of quantitative causal effects in social epidemiology. To put systems models in context, we will describe how this ...

Causal inference is the process of drawing a conclusion about a causal connection based on the conditions of the occurrence of an effect. The main difference between causal inference and inference of association is that the former analyzes the response of the effect variable when the cause is changed.
