Finding global maxima and minima is the goal of mathematical optimization. If a function is continuous on a closed interval, then by the extreme value theorem , global maxima and minima exist. Furthermore, a global maximum (or minimum) either must be a local maximum (or minimum) in the interior of the domain, or must lie on the boundary of the domain.

Types of Maxima and Minima. The maxima or minima can also be called an extremum i.e. an extreme value of the function. Let us have a function $y = f(x)$ defined on a known domain of x . Based on the interval of x , on which the function attains an extremum, the extremum can be termed as a 'local' or a 'global' extremum.

Maxima and Minima: Explanation, Types, Examples and Videos

This chapter discusses the theory of maxima and minima. The theory of ordinary maxima and minima is concerned with the problem of finding the values of each of n independent variables x_1, x_2, \dots, x_n at which some function of the n variables $f(x_1, x_2, \dots, x_n)$ reaches either a maximum or a minimum (an extremum). This problem may be interpreted geometrically as the problem of finding a ...

The concepts of Set Theory are applicable not only in Quant / DI / LR but they can be used to solve syllogism questions as well. Let us first understand the basics of the Venn Diagram before we move on to the concept of maximum and minimum.

Then i) $f(c)$ is a maximum value of f on S if $f(c) \geq f(x)$ for all x in S . ii) $f(c)$ is a minimum value of f on S if $f(c) \leq f(x)$ for all x in S . iii) $f(c)$ is an extreme value of f on S if it is the maximum or a minimum value. iv) the function we want to maximize or minimize is called the

Maxima Minima Concept based on Set theory or Venn diagram is very important for CAT exam not only in Quant section but more so in LRDI section. Many varieties of questions can be framed from this area. In most of the cases, we are required to find maximum and minimum value in Venn diagram related questions.

Maxima and Minima. Let f be a function defined on an interval I . Then (a) f is claimed to possess a maximum value in I , if there exists some extent c in I such $f(c) > f(x)$, for all $x \in I$. The number $f(c)$ is named the utmost value of f in I and therefore the point c is named some extent of the maximum value of f in I .

Before going to maxima/minima questions, we will brush up some theory related to Quadratic equation. Definition. Any equation of degree 2 is known as a quadratic equation. General form is $ax^2 + bx + c = 0$ The numbers a, b are called the coefficients of this equation and c is the constant. Roots

Note: From our definition of absolute maxima and minima, if $f(a, f(a))$ is an absolute max/min, then it is also a local max/min too.

maxima or minima at a point c then c must be a critical point. More explicitly, every maxima and minima occurs at a critical point but not all critical points give maxima or minima. If you don't remember this fact, think about the example $f(x) = x^3$. An analogous but slightly more complicated theory holds in the two variable case.

Maxima and minima mc-TY-maxmin-2009-1 In this unit we show how differentiation can be used to find the maximum and minimum values of a function. Because the derivative provides information about the gradient or slope of the graph of a function we can use it to locate points on a graph where the gradient is zero. We shall see that such
