Microorganisms within the Eukarya include fungi, protozoa and algae. In addition to the major domains, the other important biological entities are a unique group known as viruses that can infect eukaryotic or prokaryotic organisms. Viruses have no metabolic capacity and rely on infected hosts to produce viral parts that self-assemble.

At least 50 percent of the O₂ on earth is produced by photosynthetic microorganisms (algae and cyanobacteria), and for at least a billion years before plants evolved, microbes were the only organisms producing O₂ on earth. O₂ is required by many types of organisms, including animals, in their respiratory processes.

Impact of Microbes on the Environment

The many and varied metabolic activities of microbes assure that they participate in chemical reactions in almost every environment on earth. As discussed # previously, microbes require an energy producing system (including an electron acceptor) to sustain life and nutrients, including liquid water, in order to grow and reproduce.
