Control of composition, stoichiometry, and defects in colloidal quantum dots (QDs) of III-V semiconductors has proven to be difficult due to their covalent character. Whereas the synthesis of colloidal indium pnictides such as InP, InAs, and InSb has made significant progress, gallium-containing colloidal III-V QDs still remain largely elusive.

Molten-salt reactors (MSEs) offer many advantages over the conventional light-water reactors. Many thermophysical, thermochemical, and transport properties of molten chloride salts relevant to fast-spectrum MSEs are not available. We use MD simulations to predict structure/coordination, spectral features, and thermophysical properties of molten chlorides.
