The majestic monarch butterfly (Danaus plexippus), is strikingly royal in appearance, and yet these delicate creatures migrate 6,000 miles roundtrip, from Mexico to Canada and back, every year. The majestic monarch is dependent on one plant to repopulate: The humble milkweed plant, (Asclepias syriaca).

### Monarch Butterflies and Milkweed: A Complex Relationship ...

Milkweed for Monarchs Monarch caterpillars feed exclusively on the leaves of milkweed, the only host plant for this iconic butterfly species. As such, milkweed is critical for the survival of monarchs. Without it, they cannot complete their life cycle and their populations decline.

### Milkweed for Monarchs - National Wildlife Federation

The monarch is the only butterfly known to make a two-way migration as birds do. Unlike other butterflies that can overwinter as larvae, pupae, or even as adults in some species, monarchs cannot survive the cold winters of northern climates. Using environmental cues, the monarchs know when it is time to travel south for the winter.

### Monarch Butterfly Migration and Overwintering

Fall – southerly migration. Temperatures begin to drop, day length shortens, milkweed and nectar sources become sparse and the monarch realizes that it is time to head to Mexico. Most monarchs live four to six weeks, but those born at this time will have a different biological makeup that allows them to make such a strenuous migration.

### Worldwide Monarch Migration - Missourians for Monarchs

Monarch butterflies carry out a remarkable migration pattern year after year. Monarchs born in Midwestern states move south during the late summer and fall and arrive in central Mexico for the winter. The monarchs then move northward again in the spring. But the monarch population has dwindled to such an extent over the last two decades that scientists worried the migratory system could collapse forever. Focus on milkweed
