Multivariate Analysis can be used to read and process data stored in various database from the rows and columns of the database table to meaningful data. This technique is used to get an overview of a table in a database often called as factor analysis that reads heavy patterns in the data such as trends, groups, outliers and their repetitions forming a pattern.

If the data were all independent columns, then the data would have no multivariate structure and we could just do univariate statistics on each variable (column) in turn. Multivariate statistics means we are interested in how the columns covary. We can compute covariances to evaluate the dependencies.
