This type of observation can be divided into two types: performance analysis and task analysis. Some of us observe ADL task performance in order to analyze the level of physical effort, efficiency, safety, or independence the person demonstrates as he or she performs each goal-directed action or performance skill during the task performance.

While the first step in the Analysis Phase, Business Outcome, determined the desired goals to improve the organization, this step, Performance Analysis, determines the exact cause of the performance deficiency that is preventing the organization from reaching its objectives and then identifying the performance required to reach the objective. This is shown in the backwards planning model (the second level from the top):
