Radar consist of transmitter and receiver in one device. It works by sending an impulse and receiving the impulse after being reflected by the certain object. The distance between radar and object can be calculated from the total amount of impulse travel time multiplied by the light velocity.

The next radar system has been set up! This time it is a Dual CW Radar. The processing is related to the previous FSK Radar but has a much clearer spectrum due to the lack of splitting the signal. Therefore you get better detections than the FSK Radar. In particular the DC peak is present only at the zero frequency bin.
