The 9 questions have students write a nuclear equations, predict daughter products (defined in Q. 2), practice alpha decay with several isotopes and summarize the mass of daughter products after alpha decay (Nuclear Decay_Key). The goal is to realize that alpha decay will reduce the mass of isotope by 4 and atomic number by 2.

This decay is random, and it depends on the nature of the element: this is radioactivity. The half-life of a given isotope is the amount of time it takes for half of the atoms in a sample to decay. This simulation allows you to address, using three different isotopes, notions like radioactive decay, carbon dating, half life constant.

Lab: Simulating Radioactive Decay Background You have been learning about radioactive decay of atoms and about half-life. In this simulation you will cut a piece of paper on a regular schedule to have a hands-on model for the math of half-life.

Lab: Simulating Radioactive Decay

1. The initial decay rate is very fast, but the decay rate decreases over time. 2. Due to randomness, the last couple of radioactive atoms may take a long time before they become nonradioactive. 3. The pattern becomes very predictable. 4. Only a few radioactive nuclei are left to decay, so fewer and fewer atoms decay. 5.

Predict what happens to an element when it undergoes alpha decay. Explain the concept of half life, including the random nature of it. Begin to gain an understanding of the forces that work to hold an atomic nucleus together (strong nuclear force) and the forces that work to break it apart (Coulomb, i.e. electric charge, force).
