by functioning like a distance-vector protocol when it comes to processing routing updates; but instead of sending out periodic updates like a distance-vector protocol, hybrid routing protocols send out incremental, reliable updates via multicast messages, providing a more network- and router-friendly environment.

Basic Routing Concepts and Protocols Explained

Routing protocol shares routing update that contains network information. Routers keep this information in routing tables. Routing tables are used to determine the best path for packet. Routing protocols uses several concepts to determine the best path. IP Routing. IP routing is the process of moving data packets between different networks.

Hundreds of different network protocols have been created for supporting communication between computers and other types of electronic devices. So-called routing protocols are the family of network protocols that enable computer routers to communicate with each other and in turn to intelligently forward traffic between their respective networks.

Routers use static routes and dynamic routing protocols to learn about remote networks and build their routing tables. Routers use routing tables to determine the best path to send packets. Routers encapsulate the packet and forward it to the interface indicated in routing table.

There are two primary routing protocol types although many different routing protocols defined with those two types. Link state and distance vector protocols comprise the primary types. Distance vector protocols advertise their routing table to all directly connected neighbors at regular frequent intervals using a lot of bandwidth and are slow to converge.
