Thus almost all the objects of Mathematics can be described as sets: A natural number is a set of sets (a cardinal), a rational number is a set of pairs (an equivalence class), a real number is a set of rationals (a Dedekind cut), and a function is a set of ordered pairs (a table of values).

The introduction of the notion of fuzzy set by Zadeh (1965) was mainly motivated by the problem of modelling linguistically expressible categories with unsharp boundaries. Then starting with the usual convention for set characteristic functions: zero (0) for non-membership, one (1) for membership, it leads to take (0,1) as a possible set of intermediary degrees of membership.

Category Theory and Categorical Logic. The rst part on Category Theory should be of interest to a general math-ematical audience with interest in algebra, geometry and topology where at least the language of category theory and some of its basic notions like lim-its, colimits and adjoint functors are indispensable nowadays. However, for

the basic concepts of logic requires some familiarity with the mathematical notions of sets, relations, functions and trees. For these reasons, the book takes a different tack. In its early chapters, notions of logic are identifiedbriefly as they arise in the discussionof more 'concrete'material. This is done in 'logic boxes'.
