That's why solving multi-step equations are more involved than one-step and two-step equations because they require more steps. The main goal in solving multi-step equations, just like in one-step and two-step equations, is to isolate the unknown variable on one side of the equation while keeping the constant or number on the opposite side.

### **Solving Multi-Step Equations - ChiliMath**

This is a single step equation. You can also get a two-step equation. You solve the two-step equation in the same manner as the single-step equation. The only difference is that it has some additional steps. For example:  $3x + 4 = 15$ ,  $3x + 4 - 4 = 15 - 4$ ,  $3x = 11$ ,  $x = 11/3$ . Besides single-step and two-step equations, you can also get multi-step ...
