The Hopkinson pressure bar was first suggested by Bertram Hopkinson in 1914 as a way to measure stress pulse propagation in a metal bar. Later, in 1949 Herbert Kolsky refined Hopkinson's technique by using two Hopkinson bars in series, now known as the split-Hopkinson bar, to measure stress and strain, incorporating advancements in the cathode ray oscilloscope in conjunction with electrical condenser units to record the pressure wave propagation in the pressure bars as pioneered by Rhisiart ...

Split-Hopkinson pressure bar - Wikipedia

The objective of this book is to provide the readers with a working knowledge of dynamic experiments with a Kolsky bar, also widely known as a split Hopkinson pressure bar (SHPB). Kolsky bar has been extensively used for the characterization of material properties at high rates, where the results are a family of stress-strain curves with strain rate as a parameter.

A Split Hopkinson Pressure Bar (SHPB) is used to test the high strain rate material properties of materials. The Hopkinson bar is used to impose a dynamic load on a material specimen akin to that which the material will experience in dynamic situations like vehicle crashes or other high-energy events.

The design is similar to the compression version of Kolsky bar except the tube striker and connection between the specimen and bars, and becomes the standard design of modern SHTB. The SHTB system for measuring the dynamic tensile strength is shown in Fig. 23 , which consists of a striker tube, an incident bar, a transmitted bar, and two ...
