Fuzzification is the process of decomposing a system input and/or output into one or more fuzzy sets. Many types of curves and tables can be used, but triangular or trapezoidal-shaped membership functions are the most common, since they are easier to represent in embedded controllers.

Fuzzification is the process of assigning the numerical input of a system to fuzzy sets with some degree of membership. This degree of membership may be anywhere within the interval [0,1]. If it is 0 then the value does not belong to the given fuzzy set, and if it is 1 then the value completely belongs within the fuzzy set.

**Fuzzy logic - Wikipedia**  
Fuzzification and defuzzification are the fuzzy inferencing system steps where the fuzzification translates the precise quantity as a fuzzy quantity whereas defuzzification converts the fuzzy quantity into a crisp one. The techniques are very useful in the fuzzy inference process, where the mapping is developed from a given input to an output with the help of fuzzy logic.

The number which indicates the value in fuzzy systems is called the truth value. In other words, we can say that fuzzy logic is not logic that is fuzzy, but logic that is used to describe fuzziness. There can be numerous other examples like this with the help of which we can understand the concept of fuzzy logic.

Fuzzification it may be defined as the process of transforming a crisp set to a fuzzy set or a fuzzy set to fuzzier set. Basically, this operation translates accurate crisp input values into linguistic variables.

**Fuzzy Logic - Membership Function - Tutorialspoint**  
In mathematics, fuzzy sets are somewhat like sets whose elements have degrees of membership. Fuzzy sets were introduced independently by Lotfi A. Zadeh and Dieter Klaua in 1965 as an extension of the classical notion of set. At the same time, Salli defined a more general kind of structure called an L-relation, which he studied in an abstract algebraic context. Fuzzy relations, which are now used throughout fuzzy mathematics and has applications in areas such as linguistics, decision-making, and

Fuzzy inference is the process of formulating the mapping from a given input to an output using fuzzy logic. The mapping then provides a basis from which decisions can be made, or patterns discerned. The process of fuzzy inference involves all the pieces that are described in Membership Functions, Logical Operations, and If-Then Rules.

**Fuzzy Inference Process - MATLAB & Simulink**  
Fuzzy Logic is a computing approach that is based on "Degree of Truth" and is not limited to Boolean "true or false". The term 'Fuzzy' means something which is vague or not very clear. The fuzzy Logic system is applied to scenarios where it is difficult to categorize states as a binary "True or False".

Fuzzification step helps to convert inputs. It allows you to convert, crisp numbers into fuzzy sets. Crisp inputs measured by sensors and passed into the control system for further processing. Like Room temperature, pressure, etc.

**Fuzzy Logic Tutorial: What is, Application & Example**  
A Fuzzy Inference System will require input and output variables and a collection of fuzzy rules. Both input and output variables will contain a collection of fuzzy sets if the Fuzzy Inference System is of Mamdani type. Input and output variables are very similar, but they are used differently by fuzzy rules.
