Ticks: biology, disease and control.

How ticks spread disease. Ticks transmit pathogens that cause disease through the process of feeding. Depending on the tick species and its stage of life, preparing to feed can take from 10 minutes to 2 hours. When the tick finds a feeding spot, it grasps the skin and cuts into the surface. The tick then inserts its feeding tube.

Ticks are not insects, and the great clarification of their population dynamics in relation to pathogen transmission is a major advance for vector biology in general. Tick salivary glands are wonderful subjects for anatomical, physiological and biochemical study and as a source of pharmacological agents they are a deep and rich mine.

Bowman A, Nuttall P: Ticks: Biology, Disease and Control ...

Spraying ticks directly in their natural habitats in forests and fields may control outbreaks of certain tick-borne diseases (e.g. Lyme disease (38) and tick-borne encephalitides). Large areas may be treated by ultra-low-volume spraying of liquid acaricide concentrates from fixed-wing aircraft or helicopters.

Ticks - WHO

The disease is prevalent in the northeastern United States where the black-legged tick, *Ixodes scapularis* (formerly called the deer tick, *Ixodes dammini*) is the vector of the Lyme disease spirochete. The black-legged tick in the Southeast does not tend to bite humans and as a result many fewer cases of Lyme disease are found.
